

Si la propriété `isInEditMode` est égale à `true` on affiche le contenu du `<span>` sinon on affiche ce `<span>` là.

```
class Article extends React.Component{
  state = { isInEditMode: false};

  toggleEditMode={()=>{
    this.setState({ isInEditMode: !this.state.isInEditMode });
  }}

  render(){
    return (
      <div>
        <button className="btn btn-warning btn-xs edit" onClick={()=>this.toggleEditMode()} >modifier</button>
        {
          this.state.isInEditMode ?
            <span>en edit mode</span>
            : <span>{this.props.data.quantity} {this.props.data.name}</span>
        }
      </div>
    );
  }
}
```
